**Q.2.**(Marks : 6) 245Anton26. **Production Control.** An oil company operates two refineries in a certain city. Refinery I has an oupput of 200, 100, and 100 barrels of low-, medium-, and high-grade oil per day, respectively. Refinery II has an oupput of 100, 200, and 600 barrels of low-, medium-, and high-grade oil per day, respectively. The company wishes to produce at least 1000, 1400, and 3000 barrels of low-, medium-, and high-grade oil to fill an order. If it costs \$200/day to operate refinery

I and \$ 300/day to operate refinery II, determine how many days each refinery should be operated to meet the requirements of the order at minimum cost to the company. Set up the linear programming problem without solution.

**Answer.** Let  $x$  = the number of days to operate refinery I.

Let  $y$  = the number of days to operate refinery II.

**Objective**
