Exercice 1 (35 pts)

Given the following pair of linear programs:

\[
\begin{align*}
\text{max}_{x,y} & \quad z = x + 2y \\
\text{s.t} & \quad y \leq \frac{1}{3}, \quad x + y \leq 1, \quad x, y \geq 0
\end{align*}
\]

\[
\begin{align*}
\text{min}_{\alpha,\beta} & \quad \gamma = \alpha + 3\beta \\
\text{s.t} & \quad \beta \geq 1, \quad \alpha + \beta \geq 2, \quad \alpha, \beta \geq 0.
\end{align*}
\]

(a) Solve each linear program graphically.(10pts)

The optimal solution the first program is: \( x^* = \frac{2}{3}, \ y^* = \frac{1}{3} \) and the the optimal objective is \( z^* = \frac{4}{3} \). The optimal solution the second program is: \( \alpha^* = 1, \ \beta^* = 1 \) and the the optimal objective is \( \gamma^* = 4 \).

(b) Is there any relation between these two linear programs. (5pts)

There is a Primal-Dual relation between the two linear programs.

(c) Write the complementary slackness conditions corresponding to these two linear programs. (10pts)

The complementary slackness conditions corresponding to the two linear programs can be expressed:

\[
(\alpha, \beta) \left[ \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} - \begin{pmatrix} 1/3 \\ 1 \end{pmatrix} \right] = \begin{pmatrix} 0 \\ 0 \end{pmatrix}
\]

(d) Propose a method to linearize these complementary slackness conditions. (10pts)

To linearize these conditions we introduce the binary vector of variables \( u \) and two real parameters \( K \) and \( L \) arbitrarily chosen with \( K < 0 \) and \( L > 0 \).

Conditions written in (c) can then be written as follows:

\[
\left[ \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} - \begin{pmatrix} 1/3 \\ 1 \end{pmatrix} \right] \geq K \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}
\]
\[
\begin{bmatrix}
0 & 1 \\
1 & 1
\end{bmatrix}
\begin{bmatrix}
x \\
y
\end{bmatrix}
\begin{bmatrix}
0 \\
\frac{1}{3}
\end{bmatrix}
\leq
\begin{bmatrix}
0 \\
0
\end{bmatrix}
\]
\[
\begin{bmatrix}
\alpha \\
\beta
\end{bmatrix}
\leq L(1 - u),
\]

\[
\begin{array}{c}
\beta \geq 1 \\
\alpha + \beta \geq 2 \\
x, y \geq 0, \\
\alpha, \beta \geq 0.
\end{array}
\]
Exercice 2

Consider the following linear program:

\[
\begin{align*}
\text{max} & \quad 3x_1 + 2x_2 + x_3 \\
\text{s.t} & \quad x_1 + x_2 + 2x_3 \leq 3, \\
& \quad x_1 - x_2 + x_3 \geq 2, \\
& \quad 2x_1 + x_2 + x_3 \leq 4, \\
& \quad x_1, x_2, x_3 \geq 0.
\end{align*}
\]

(a) Solve the linear program using the Primal Simplex algorithm.

Solving the program:

The solution is primal feasible but not optimal as the reduced cost are not all negative.

Here is the first Simplex Tableau;

The solution is optimal.
Exercice 3

Consider the following nonlinear program:

$$\min_{x, y} f(x, y) = x^2 - 3x^2y^2 + 2y^2$$

where $x$ and $y$ are real decision variables.

(a) Give the first order optimality conditions and find all points satisfying these conditions.

$$\frac{\partial f}{\partial x} = 2x - 6xy^2 = 0$$

$$\frac{\partial f}{\partial y} = -6x^2y + 4y = 0$$

There are 5 points satisfying these conditions: $(0, 0)$, $(\sqrt{2/3}, \sqrt{1/3})$, $(-\sqrt{2/3}, \sqrt{1/3})$, $(\sqrt{2/3}, -\sqrt{1/3})$ and $(-\sqrt{2/3}, -\sqrt{1/3})$.

(b) Give the second order optimality conditions.

$$d^T \nabla^2 f(x, y) d \geq 0$$

to have a minimum.

(c) Conclude on the optimality of each point found in (a).

The only relative minimum here is $(0, 0)$ as $d^T \nabla^2 f(0, 0) d = 2d_1^2 + 4d_2^2 > 0$.
