Learning Outcomes:

Upon completion of this course, students will be able to:

1. Recognize the vector fields, their curl and divergence, and test whether they are conservative.
2. Evaluate line integrals along planes or space curves and the surface integrals over surfaces in three dimensional space.
3. Use Green's, Stokes' and Divergence theorems to relate and evaluate different types of integrals.
4. Evaluate the Laplace transform and inverse Laplace transform of some functions.
5. Apply Laplace transform, inverse Laplace transform, and their operational properties to solve linear initial-value and boundary-value problems.
6. Find the Fourier series, the Fourier cosine and sine series, and the Bessel and Legendre series of some functions.

7. Find the eigenvalues and eigenfunctions for some Sturm-Liouville boundary-value problems and state their orthogonality relations.
8. Solve partial differential equations involving the wave, heat and Laplace equations in various coordinate systems using the separation of variables technique.
9. Evaluate Laplace transform, inverse Laplace transform, and their operational properties to solve some partial differential equations.
10. Use the Fourier transform, inverse Fourier transform, and their operational properties to solve partial differential equations.
